浜端悦治博士が収集したモンゴル国産水生植物標本コレクションの概要

藪内喜人¹・横川昌史²・Purebee ARIUNSUREN³・浜端悦治^{4†}

抄録: 2004年から2013年にかけて浜端悦治博士によって収集されたモンゴル国産水生植物標本の概要を紹介する。浜端博士はモンゴル国の75の調査地で調査を行い、1,696点の標本を採集した。モンゴル国の水生植物相研究は未だ十分ではないため、これらの標本の中にはモンゴル国の水生植物相の解明にとって重要なものが含まれている可能性がある。本報告は、コレクションの概要を示すものであり、種レベル以下の同定の検討は今後の課題である。

Abstract: We overviewed the aquatic macrophyte specimens collected by Dr. Etsuji Hamabata in Mongolia between 2004 and 2013. He surveyed in 75 study sites in Mongolia and collected 1,696 specimens. Because the study of the aquatic macrophyte flora of Mongolia is not yet sufficient, the collection may contain important specimens for the study of aquatic macrophyte flora of Mongolia. This report gives just the overview of the collection, and further identification to the species level will be required in the future.

Key words: aquatic plant; Charales; inland waters; *Potamogeton*; *Stuckenia*; water plant

Over view of the collection

Dr. Etsuji Hamabata, one of the authors, studied aquatic macrophyte flora in Mongolia for 10 years between 2004 and 2013. Since he passed away on July 24, 2014, the specimens he collected have remained provisionally identified. These specimens were donated to the Lake Biwa Museum in Shiga Prefecture, Japan. At the time of our herbarium survey, the donated specimens were stored between newspapers with specimen numbers. All specimens are linked to digital data by their specimen numbers, and information of their collected location and date can be referred. These specimens will eventually be arranged on specimen shelf. This report provides an overview of the aquatic macrophyte specimens collected by Dr. Hamabata in Mongolia to provide a basis for the study of aquatic flora in Mongolia.

Dr. Hamabata visited 75 study sites between 2004 and 2013, and many of these study sites were lakes and rivers (Fig 1; Table 1; Appendix 1). The latitude and longitude figures for these study sites are based on GPS data acquired by Dr. Hamabata during the field survey, although some latitude and longitude figures were estimated from Dr. Hamabata's notes in compiling this manuscript. There were four lakes where more than 100 specimens were collected: Khuvsgul Lake including a lagoon and an attached lake (342 specimens), Ogii Lake (239 specimens), Dalai lake (176

specimens), and Dood Tsagaan Lake (113 specimens). A total of 1,696 specimens, 1,513 vascular plants (31 genera in 18 families) and 183 Charales (3 genera in 1 family), were collected (Table 2; Appendix 1). Particularly abundantly collected genera include *Potamogeton* (503 specimens), *Stuckenia* (333 specimens), *Chara* (143 specimens), and *Myriophyllum* (109 specimens), with these genera containing many submerged macrophytes. On the other hand, genera with emergent plants content, such as *Sagittaria*, *Typha*, *Schoenoplectiella*, and *Scirpus*, were rarely collected.

The Potential value of the Dr. Hamabata's collection in the Mongolian aquatic macrophytes studies

Although about 180 species of water plants are thought to grow in Mongolia (Dulmaa and Urgamal, 2014), the aquatic macrophyte flora has not been properly studied (Shiga et al., 2020a). Several studies of aquatic macrophyte flora in Mongolia are known (Jamsran and Nyambayar, 2009; Hayasaka, 2011), and some flora surveys have found aquatic macrophytes that are new to Mongolia, even though the amount of effort has not been sufficient for an aquatic macrophyte flora survey (Baasanmunkh et al., 2019; Shiga et al., 2020b). Thus, the study of the aquatic macrophyte flora in Mongolia is still inadequate, and the accumulation of specimens and their identification and taxonomic studies are needed. Dr. Hamabata's 1,696 specimens reported here may contain important specimens for the study of aquatic macrophyte flora of Mongolia. However, many of these specimens have not yet been identified accurately. Evaluation of these specimens is needed based on accurate identification and taxonomic studies.

Acknowledgments

We thank to M. Ashiya (Lake Biwa Museum) for allowing us to examine specimens. We also thank Y. Kagotani for providing data left in Hamabata's computer, and A. Tanaka for aggregating these data. The following people assisted in field study: M. Nishino, K. Tanimoto, T. Saito, S. Nakaoka, E. Maenaka, K. Okubo, M. Ando, T. Ohno, T. Ikeuchi, S. Yamaguchi, D. Kado, S. Watanabe, Y. Nuno, S. Tsukiyama, Y. Tanigawa, S. Iwahashi, I. Tanaka, A. Noisshiki, and S. Maruno. In particular, R. Battogtokh made great efforts to support the field studies. We thank T. Shiga for giving us a variety of advice for publish this manuscript. This work was supported by JSPS KAKENHI Grant Number 16255004.

Author contribution and permission

Hamabata made the overall plan for field survey and specimen collection. Hamabata and Ariunsuren led the field surveys, and Yabuuchi and Yokogawa also participated in some of the surveys. Hamabata collected and organized the specimens. Yabuuchi identified to genus and listed the remaining unidentified specimens, with Yokogawa helping him. Yokogawa prepared manuscript. Yabuuchi, Ariunsuren and Yokogawa revised manuscript. This study was conducted with the necessary permissions.
